

Renewable Energy Policy

Energy is a basic requirement for economic development, every sector of economy such as agriculture, manufacturing, transport, commercial, and domestic uses/needs inputs of energy.

The long term uncertainties in the energy sector have put pressure on the global energy sector, and renewable energy seems to be a better solution to the everlasting problem of fossil fuels.

Due to the heavy demand, shortages & high prices of fossil fuels & promotional Government policies for BIOFUELS, search for the sources of renewable energy is become a necessary requirement of current century.

We generate electricity using Bagasse, a byproduct of Sugar Process as Fuel. This reduces greenhouse gas emissions and carbon footprint. Using sugarcane bagasse as our primary feedstock, we operate cogeneration boilers that generate 30MW of electricity, and steam for process heating, which supports our in-house consumption and export of 20 MW to the grid.

Although current share of renewable energy is lower in the overall power sector, it is set to increase significantly in the near future, henceforth it is required to adopt the RENEWABLE ENERGY POLICY.
